Prof. Dr. Andreas Wipf

Friedrich-Schiller-Universität Jena

***"Exotic Phases and Phase Transitions for
Interacting Fermions"***

In the talk I will present new results about the critical flavor number in 3-dimensional Thirring models and on the existence or non-existence of inhomogeneous phases in Gross-Neveu-type theories in lower dimensions. The existence and value of a critical flavor number has been debated for almost 30 years. Only recently it has been possible to pin down this number with simulations based on chiral fermions.

The two-dimensional Gross-Neveu model at finite bayon density show spontaneous breaking of translational invariance in the limit where the number of flavors N gets large. We will discuss whether this breaking is only a large-N artifact or whether inhomogeneous structures are seen for finite N. Results for various interacting Fermi systems are discussed.
